The way to SUCCeSS

valorisation of waste stream

SUCCeSS: SUperCritiCal solutions for SideStream valorisation

waste stream: ODD

- | | |
|---------------|----------|
| ■ squalene | 2,00 wt% |
| ■ tocopherols | 3,00 wt% |
| ■ sterols | 0,05 wt% |
| ■ FAME | 1,00 wt% |
| ■ FFA | 43,0 wt% |

applications & current source

squalene

How to extract the minor components?

principle of supercritical CO₂-extraction

Distinct liquid and gas phases do not exist

CO₂: critical temperature: 31°C
critical pressure: 7,4 MPa

Why supercritical CO₂?

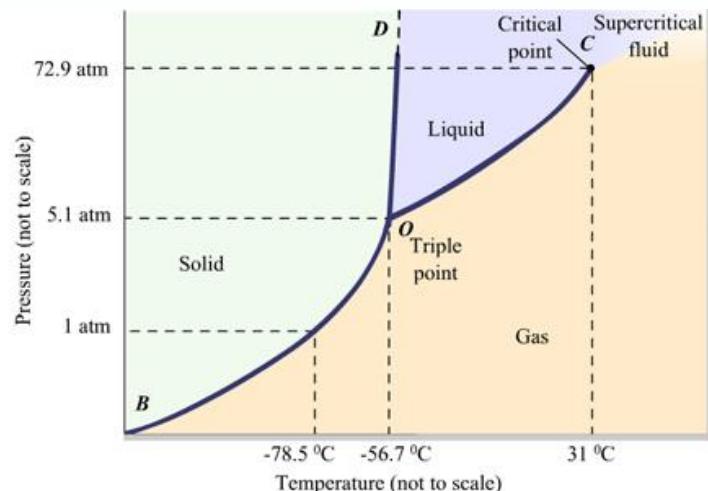

inert

lower temperature

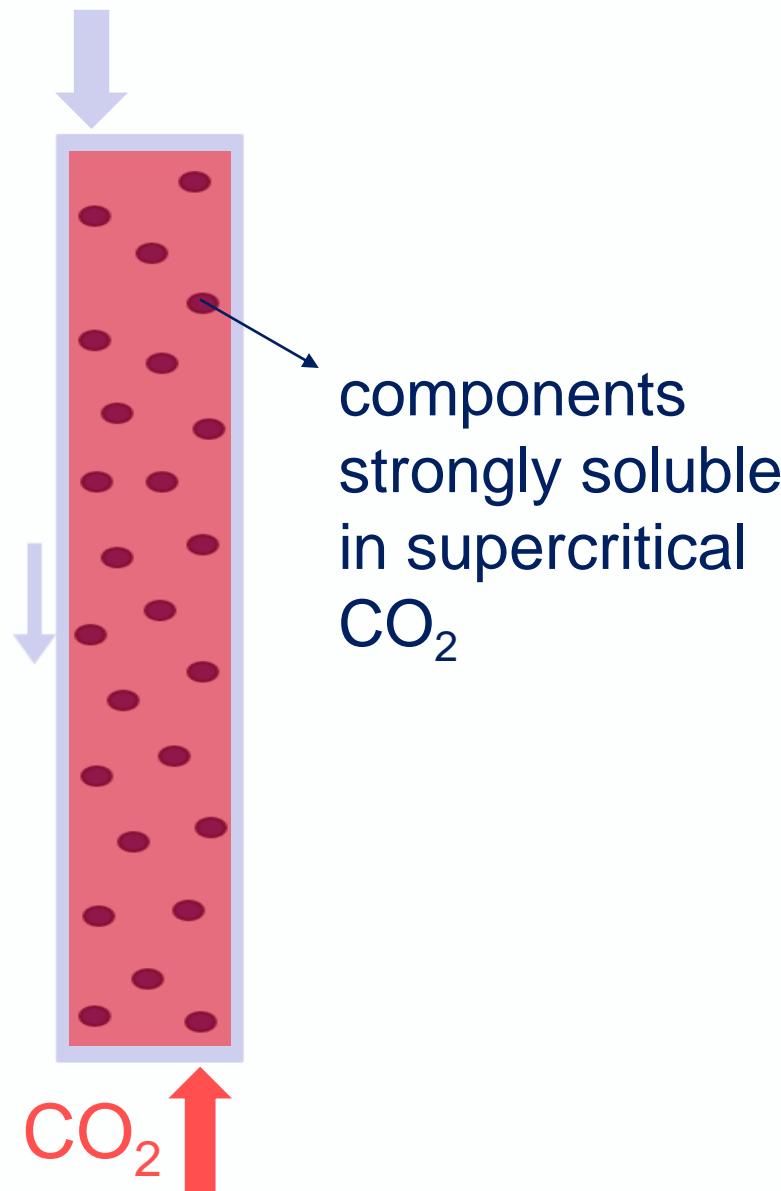

high affinity

principle of supercritical CO_2 -extraction

feed (ODD)

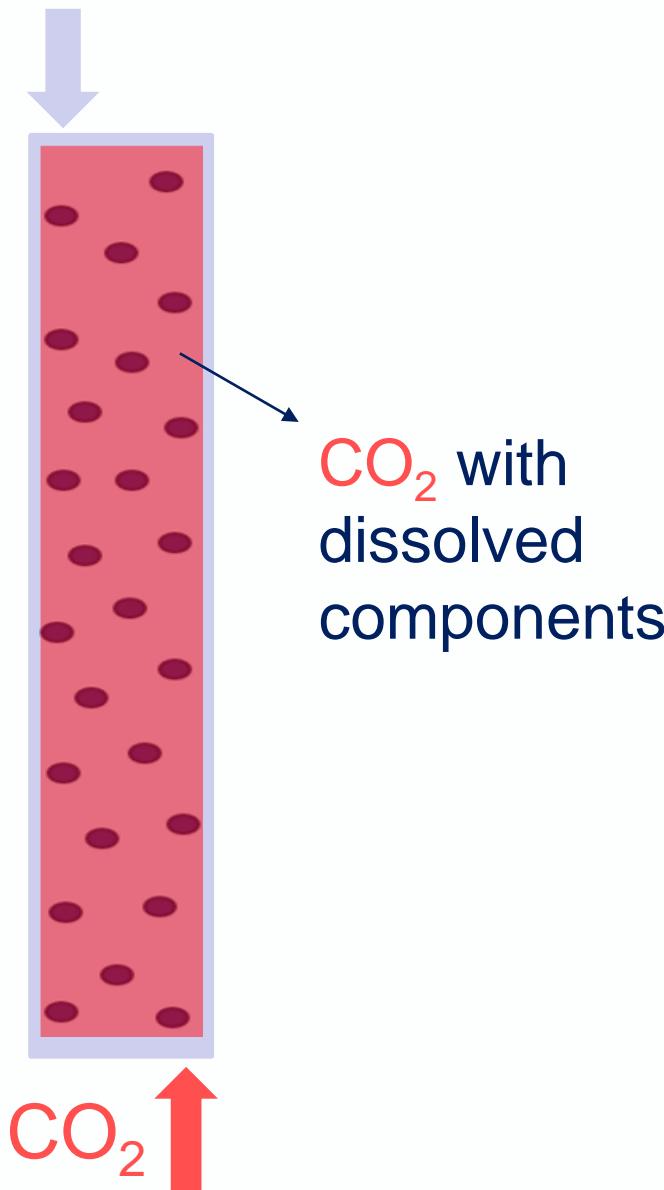

- minor components
- FFA
(free fatty acids)
- FAME
(fatty acid methyl esters)

principle of supercritical CO_2 -extraction

feed (ODD)

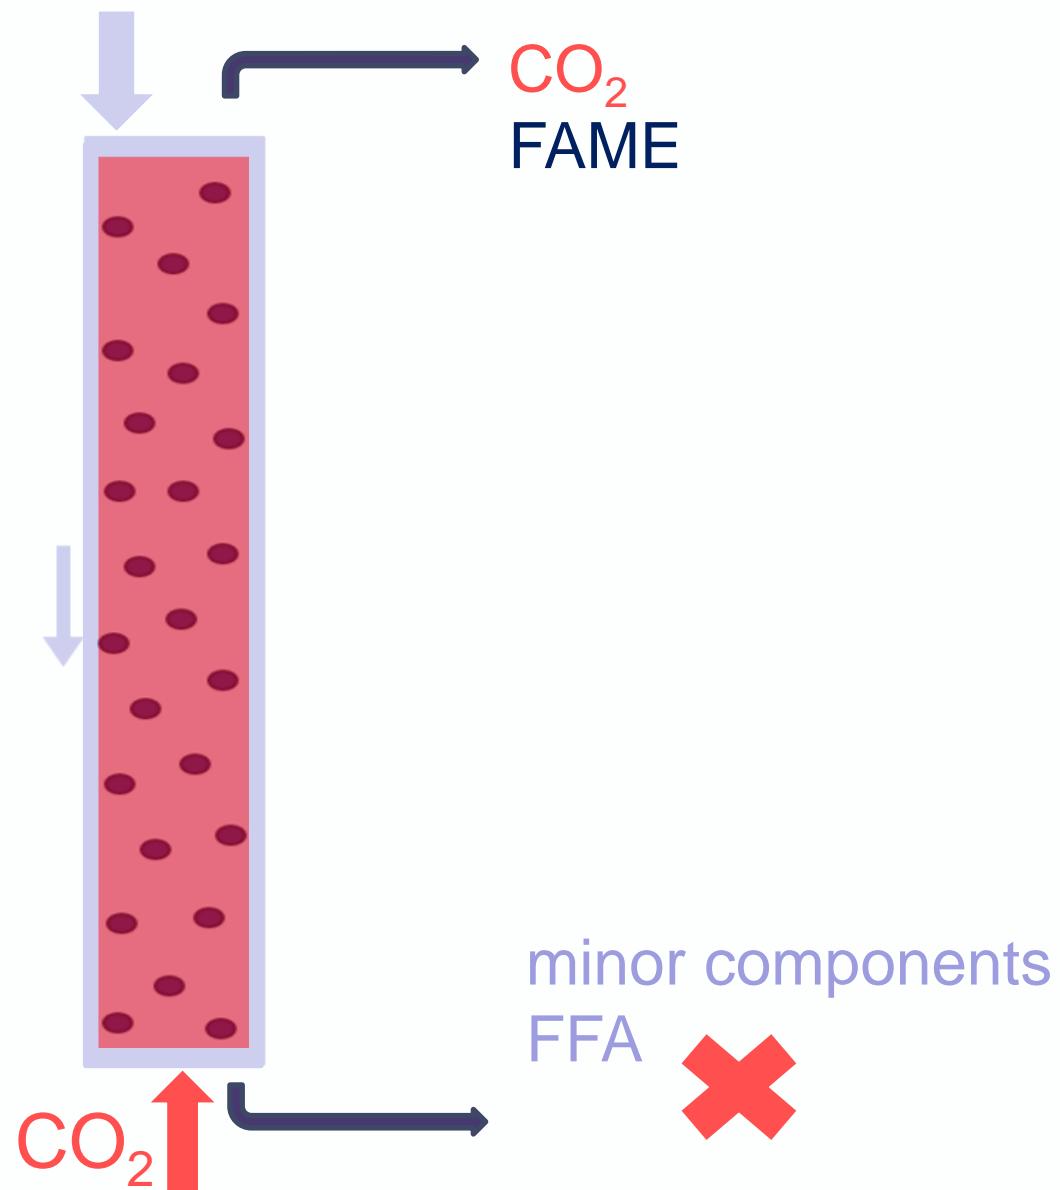

- minor components
- FFA
(free fatty acids)
- FAME
(fatty acid methyl esters)

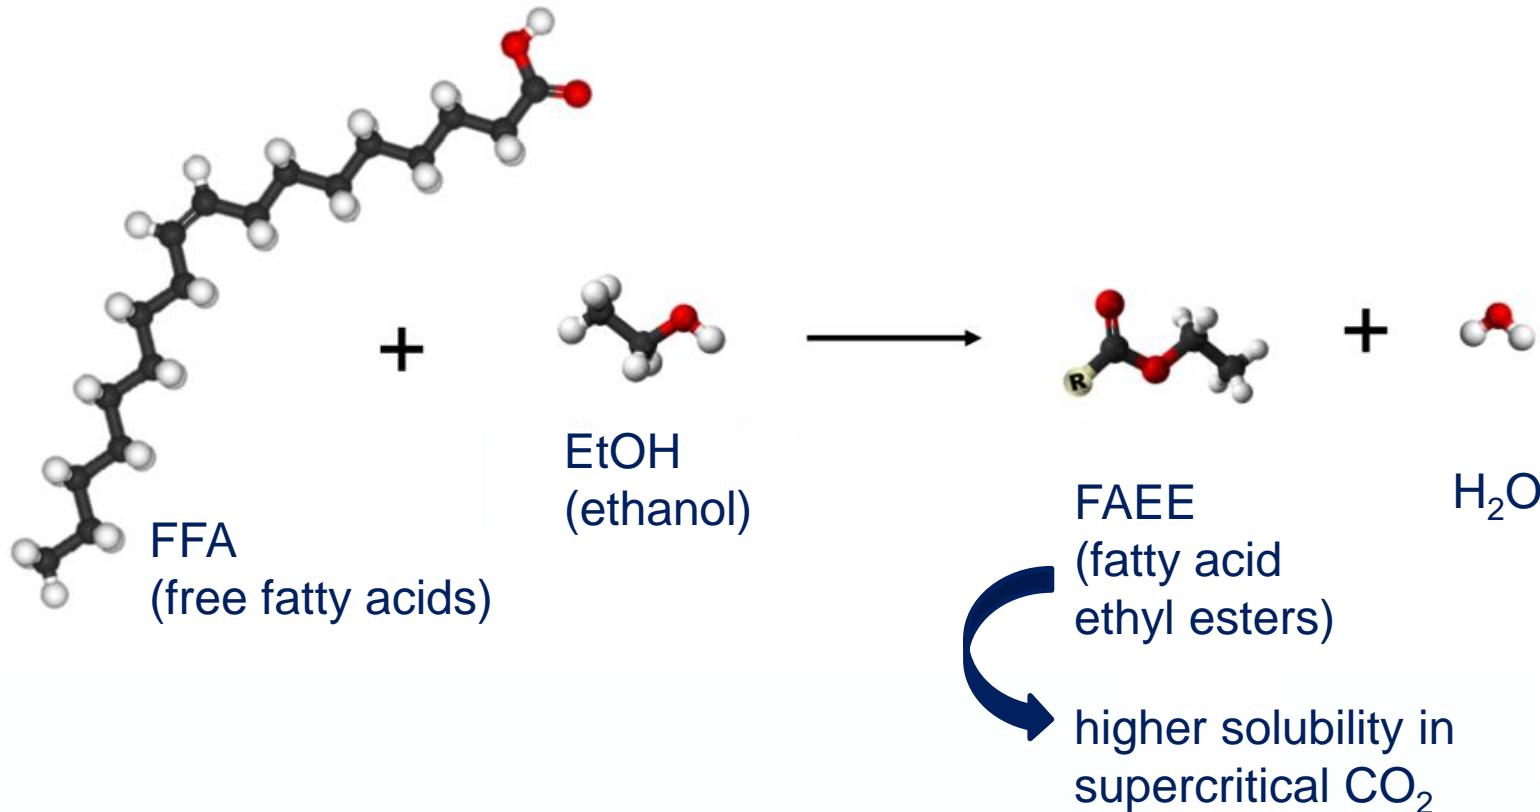

principle of supercritical CO_2 -extraction

feed (ODD)

- minor components
- FFA
(free fatty acids)
- FAME
(fatty acid methyl esters)

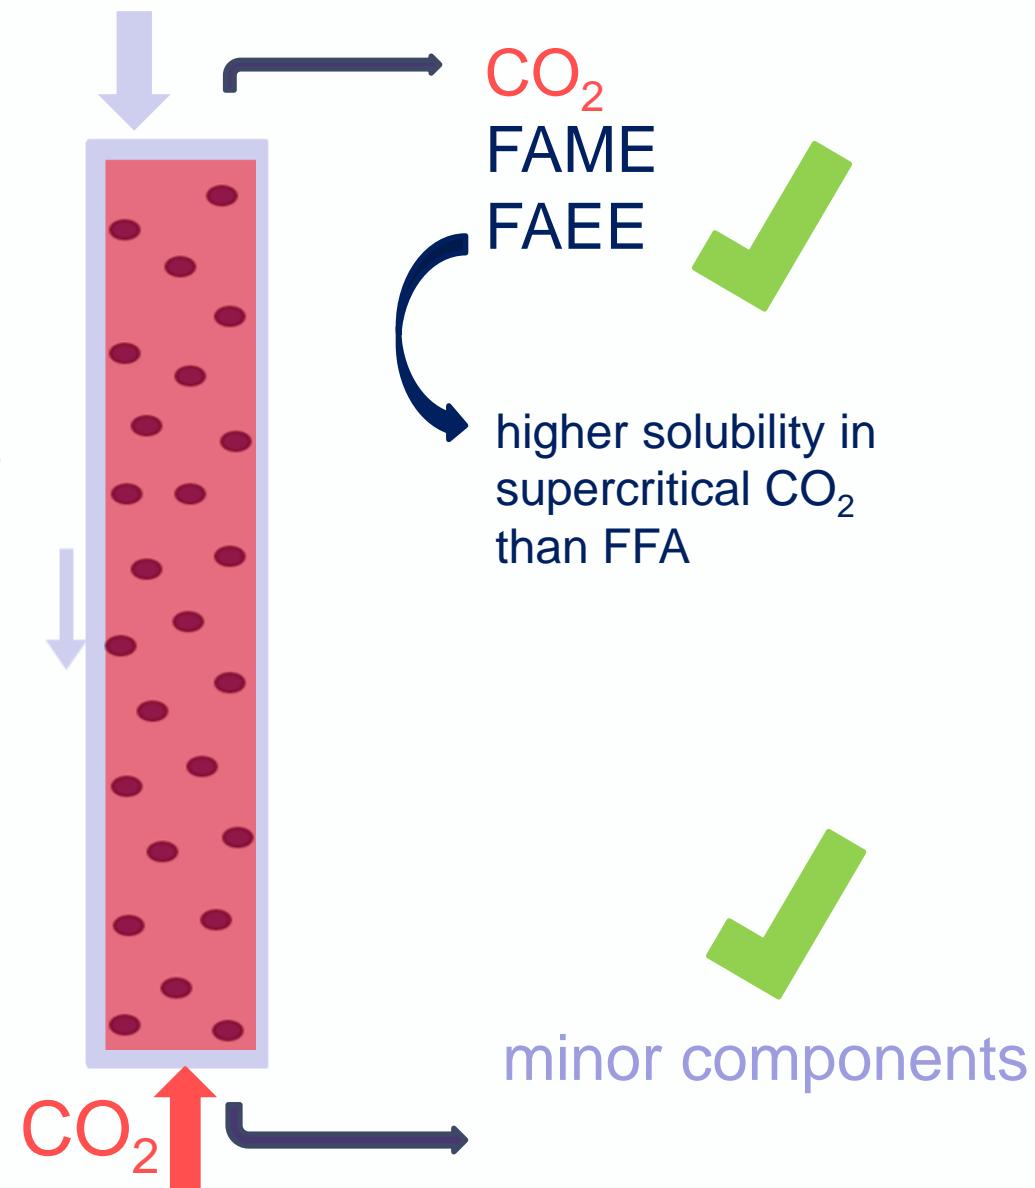

benefit of supercritical esterification

desirable supercritical CO_2 -extraction

feed

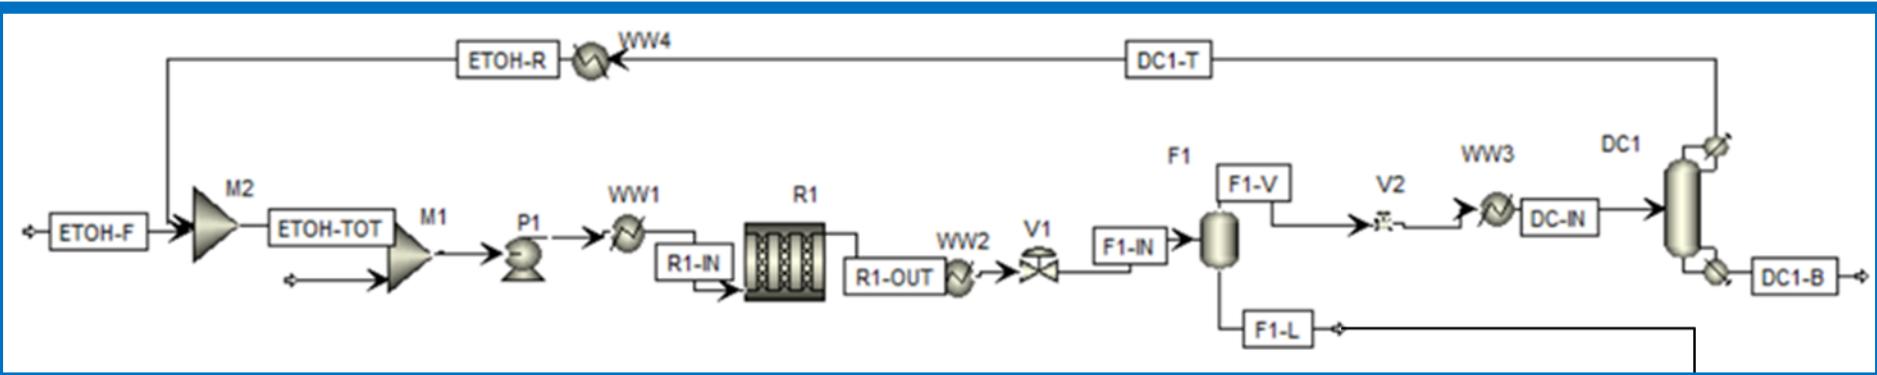

- minor components
- FAEE
(fatty acid ethyl esters)
- FAME
(fatty acid methyl esters)

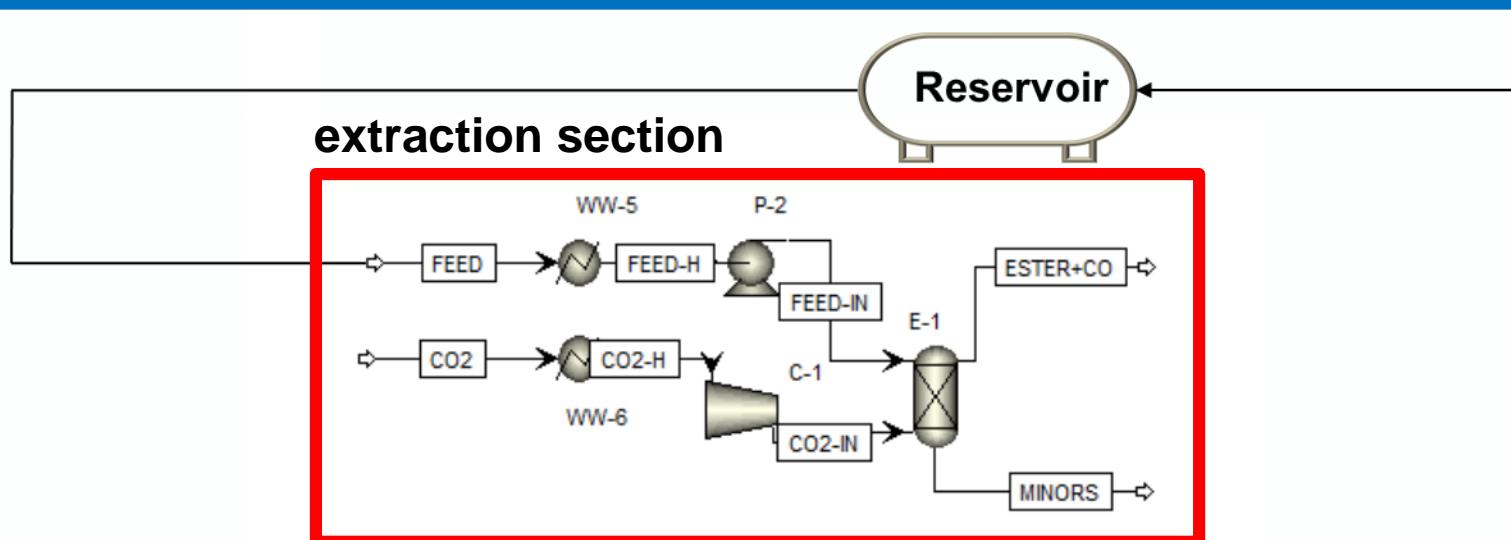

Overall process

overall process

extraction section

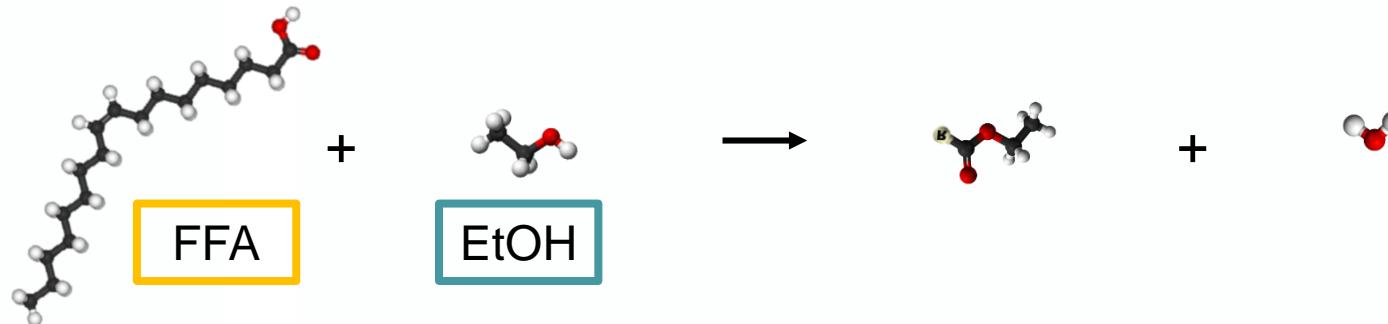

Supercritical esterification

esterification section

plugflow reactor:

conversion of 96 mol%

recycled!

Supercritical CO₂-extraction

extraction section

composition after extraction section

extract

component	amount (kg h ⁻¹)
CO ₂	0,004
FAEE	0,877
FAME	0,025
squalene	0,024
tocopherols	0,041
sterols	0,083

raffinate

component	amount (kg h ⁻¹)
CO ₂	0,023
FAEE	0,102
FAME	< 0,001
squalene	0,027
tocopherols	0,026
sterols	0,108

90% esters in top, > 50% minors recovered in bottom

optimization? → additional experimental research

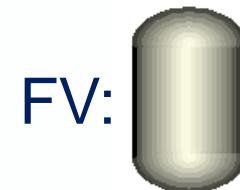

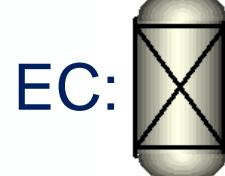

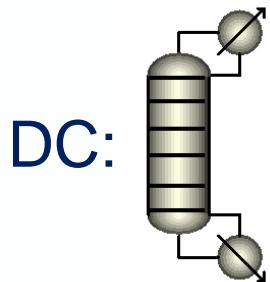

Sizing and
cost analysis of the
overall process

dimensioning of the separation units

Why?

- length and diameter (tray distance) of columns depend on process and process conditions
- dimensions determine the capital expenditures (CAPEX) of units

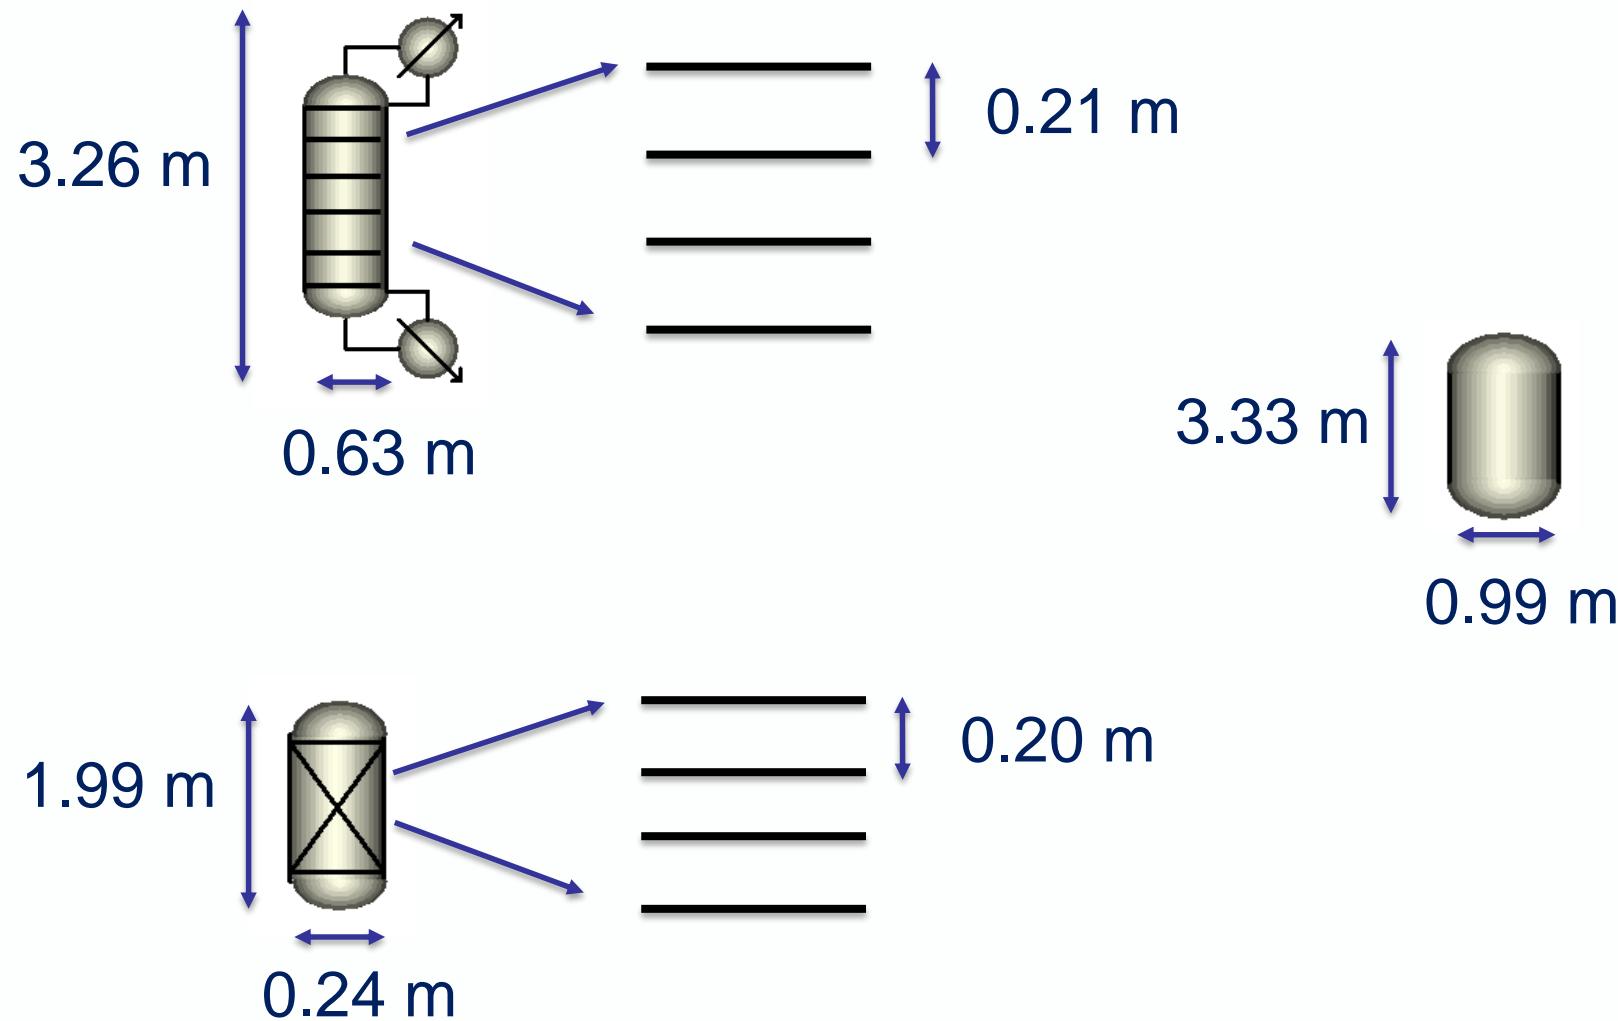

Which?

How?

- Aspen Plus
- Correlations

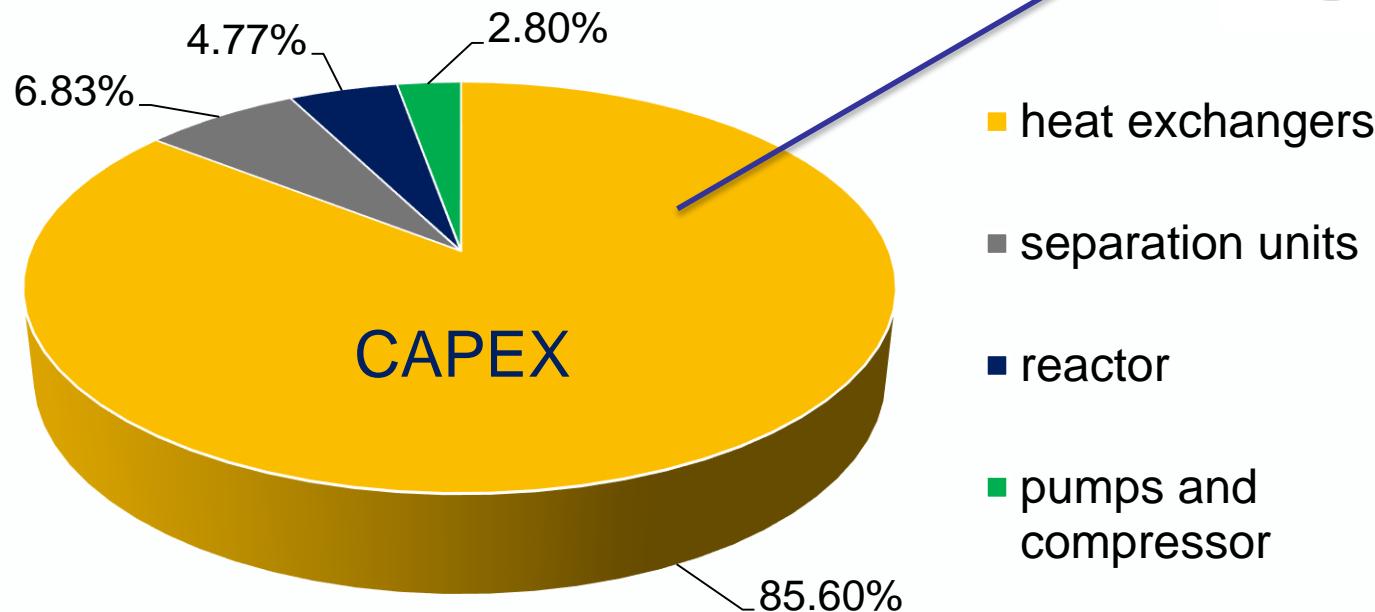

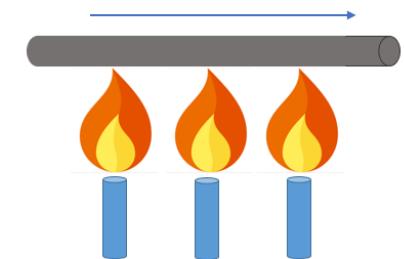

dimensioning of the separation units

capital and operating expenditures

CAPEX = 1 130 000 € (Method of Guthrie)

OPEX = 14 500 € each year (energy required)

profit

raw materials	price (€ kg^{-1})
ODD	0,56
EtOH	1,00

products	price (€ kg^{-1})
squalene	17,50
tocopherols	40,00
sterols	32,50
ethylesters	1,75

- break-even at $2,37 \text{ kg}_{\text{ODD}} \text{ h}^{-1}$
- total profit at optimal conditions: 6 042 000 € each year
(if minor components are fully separated)

Conclusion

conclusion

Waste stream valorization

Sustainable solution

Economically feasible

Further research on supercritical
extraction needed
