INTUITIONISTIC FUZZY BI-IMPLICATOR AND PROPERTIES OF LUKASIEWICZ INTUITIONISTIC FUZZY BI-IMPLICATOR

S. ASHRAF\textsuperscript{1}, M. QAYYUM\textsuperscript{2}, E. E KERRE\textsuperscript{3}, §

Abstract. This paper presents axiomatic as well as constructive definitions of intuitionistic fuzzy bi-implicators based on intuitionistic fuzzy t-norms and their intuitionistic fuzzy residual implicators. The inter-relationship among different proposed classes is presented along with a detailed study of the properties of one of these intuitionistic fuzzy bi-implicators called the intuitionistic fuzzy $\beta$–bi-implicator operator constructed using Lukasiewicz intuitionistic fuzzy t-norm and its R-implicator.

Key words: Intuitionistic fuzzy set; Intuitionistic fuzzy implicator; Intuitionistic fuzzy t-norm; Intuitionistic fuzzy bi-implicator.

AMS Subject Classification: 03E72, 68T27, 97R40, 46S40

1. Introduction

The intuitionistic fuzzy sets (IFS’s) and interval valued fuzzy sets (IVFS’s) appeared independently as appropriate generalizations of fuzzy sets (FS’s). The interval valued fuzzy sets reflected the ambiguous situations unanswered by fuzzy sets in the form of closed interval membership function $[\mu_1, \mu_2]$ such that $\mu_1, \mu_2 \in [0, 1]$ and $\mu_1 \leq \mu_2$. The intuitionistic fuzzy sets however, are equipped with a nonmembership degree $\nu$ along with the membership degree $\mu$ such that $\mu, \nu \in [0, 1]$ and $\mu + \nu \leq 1$. Though the equivalence of these two approaches has been addressed in [11], but each of these generalizations have given rise to an extensive literature covering multiple aspects of their applications and the possible extensions of fuzzy logical operators and set theoretical concepts [2, 3, 5, 9, 10, 11, 12, 13]. Moreover, the vague set (VS) which was proposed by Gau [15], as another extension of fuzzy set, was later proved in [7] to be an intuitionistic fuzzy set.

In fuzzy literature, a bi-implicator operator has been closely linked to the concepts such as fuzzy similarity [16], fuzzy equality [19], T-equivalence [17] and restricted equivalence functions [8]. Unlike their fuzzy counterpart the

intuitionistic fuzzy bi-implicator operators have not been much worked upon [18].

In this paper we aim to convey to our reader, a comprehensive picture of some new generalized classes of intuitionistic fuzzy bi-implicators having axiomatic or constructive definitions along with their mutual relationship. Such a study is expected to lay a groundwork for the development of new intuitionistic fuzzy logic or algebra having different intuitionistic fuzzy bi-implicators as basic connective operators. Furthermore, we have studied the properties and characteristics of one of the newly defined constructive bi-implicator called intuitionistic fuzzy \( \beta \)-bi-implicator by utilizing the intuitionistic fuzzy Lukasiewicz implicator along with intuitionistic fuzzy \( \text{Min} \) t-norm \([9]\) in its definition.

Also, taking into consideration the close relation between IFS’s and the other generalized fuzzy sets such as IVFS’s and the VS’s, we are in a position to claim that, all the results on intuitionistic fuzzy set theory and logic produced in this work can be easily modified and adapted to the extended frame works of any of the mentioned higher order fuzzy sets.

The work presented here is organized as follows:

Section 1 will present basic definitions and concepts of intuitionistic fuzzy set theory and logic. In Section 2 we have presented an axiomatic definition of intuitionistic fuzzy bi-implicator operators which can be regarded as intuitionistic fuzzy generalization of Fodor-Roubens fuzzy bi-implicator presented in \([14]\). Furthermore, we have proposed several new constructive approaches for defining an intuitionistic fuzzy bi-implicator using intuitionistic fuzzy t-norms and their residual implicators. We have studied their interrelationships along with their relation with the class of intuitionistic fuzzy bi-implicator having axiomatic definition. Moreover, in Section 3, we have utilized the Lukasiewicz intuitionistic implicator along with the intuitionistic fuzzy t-norm \( \text{Min} \) \([9]\) to investigate the different aspects of one of the newly defined intuitionistic fuzzy bi-implicator called \( \beta \)-bi-implicator.

**Definition 1.1** [1] An intuitionistic fuzzy set (IFS) on a universe \( X \) is an object of the form \( A = \{(x, \mu_A(x), \nu_A(x)) \mid x \in X\} \), where the functions \( \mu_A(x) \) and \( \nu_A(x) \in [0,1] \) define respectively the degree of membership and the degree of non membership of \( x \) in the set \( A \), while \( \mu_A \) and \( \nu_A \) satisfy \((\forall x \in X)(\mu_A(x) + \nu_A(x) \leq 1)\). The class of all intuitionistic fuzzy sets on \( X \) is denoted by \( IFS(X) \). A fuzzy set in \( X \) is then just an intuitionistic fuzzy set for which \( \mu_A(x) + \nu_A(x) = 1 \) holds for every \( x \in X \). The class of all fuzzy sets in \( X \) is denoted by \( F(X) \).

For an intuitionistic fuzzy set \( A = \{(\mu_A(x), \nu_A(x)) \mid x \in X\} \), we define the complement of \( A \) in \( X \) as \( A^c = \{(\nu_A(x), \mu_A(x)) \mid x \in X\} \), the Support of \( A \) in \( X \) as a subset of \( X \) given by \( \text{Supp}(A) = \{x \in X : \mu_A(x) \neq 0 \text{ or } \nu_A(x) \neq 1\} \), the Kernel of \( A \) in \( X \) as \( \text{Ker}(A) = \{x \in X : \mu_A(x) = 1 \text{ and } \nu_A(x) = 0\} \), the universe of discourse \( \Gamma_X = \{(x,1,0) \mid x \in X\} \) and the empty set by \( 0_X = \{(x,0,1) \mid x \in X\} \). As far as the extension of inclusion of IFS is concerned it is defined as: For all \( A,B \in IFS(X) \),

\[ A \subseteq B \text{ if and only if } (\forall x \in X)(\mu_A(x) \leq \mu_B(x) \text{ and } \nu_A(x) \geq \nu_B(x)). \]
Definition 1.2 [9] The set $L^* = \{(x_1, x_2) \in [0, 1]^2 \mid x_1 + x_2 \leq 1\}$ is a complete and bounded lattice $(L^*, \leq_{L^*})$ equipped with order $\leq_{L^*}$, which is defined as: $(x_1, x_2) \leq_{L^*} (y_1, y_2)$ if and only if $x_1 \leq y_1$ and $x_2 \geq y_2$. The elements $1_{L^*} = (1, 0)$ and $0_{L^*} = (0, 1)$ are the greatest and the smallest elements of the lattice $L^*$ respectively. An $IFS$ $A$ on $X$ can be equivalently defined as a mapping $A : X \rightarrow L^*$ such that for any $x \in X$, $A(x) = (\mu_A(x), \nu_A(x)) = (a_1, a_2) \in L^*$.

Definition 1.3 [9] An intuitionistic fuzzy $t$-norm is an increasing, commutative, associative $(L^*)^2 \rightarrow L^*$ mapping $\tilde{T}$ satisfying $\tilde{T}(1_{L^*}, x) = x$ for all $x \in L^*$. For instance, for all $x = (x_1, x_2), y = (y_1, y_2) \in L^*$ the greatest $t$-norm with respect to ordering $\leq_{L^*}$ is $\tilde{T}_M(x, y) = x \wedge y = (\min(x_1, y_1), \max(x_2, y_2))$ which is an extension of Max $t$-norm on $[0, 1]$ to $L^*$. Moreover, $\tilde{T}_P(x, y) = (x_1y_1, x_2 + y_2 - x_2y_2)$ is an extension of product $t$-norm and $\tilde{T}_L(x, y) = (\max(0, x_1 + y_1 - 1), \min(1, x_2 + 1 - y_1, y_2 + 1 - x_1))$ is one of the extensions of Lukasiewicz $t$-norm on $[0, 1]$ to $L^*$. The $t$-norm $\tilde{T}_M$ has the property that if $z \leq_{L^*} x \ni z \leq_{L^*} y$ then $z \leq_{L^*} \tilde{T}_M(x, y)$ for all $x, y, z \in L^*$.

Definition 1.4 [9] An intuitionistic fuzzy $t$-conorm is an increasing, commutative, associative $(L^*)^2 \rightarrow L^*$ mapping $\tilde{S}$ satisfying $\tilde{S}(0_{L^*}, x) = x$ for all $x \in L^*$. For instance, for all $x = (x_1, x_2), y = (y_1, y_2) \in L^*$ the smallest $t$-conorm with respect to ordering $\leq_{L^*}$ is $\tilde{S}_M(x, y) = x \vee y = (\max(x_1, y_1), \min(x_2, y_2))$ which is an extension of Max $t$-conorm on $[0, 1]$ to $L^*$. Moreover, $\tilde{S}_P(x, y) = (x_1 + y_1 - x_2y_1, x_2y_2) = (x_2y_1, (x_2, x_1) \forall (x_1, x_2) \in L^*$) is an extension of probabilistic sum and, $\tilde{S}_L(x, y) = (\min(1, x_1 + 1 - y_2, y_1 + 1 - x_2), \max(0, x_2 + y_2 - 1))$ is an extension of Lukasiewicz conorm to $L^*$. It must be noted that $\tilde{S}_M, \tilde{S}_P$ and $\tilde{S}_L$ conorms are the duals of intuitionistic fuzzy $t$-norms $\tilde{T}_M, \tilde{T}_P$ and $\tilde{T}_L$ respectively. It is interesting to note that for all $x, y \in L^*, \tilde{S}_L(x, 1_{L^*}) = \tilde{S}_L(1_{L^*}, y) = 1_{L^*}$.

Theorem 1.5 [12] Let $\tilde{T}$ be an intuitionistic fuzzy $t$-norm. If $\sup_{z \in Z} \tilde{T}(x, z) = \tilde{T}(x, \sup_{z \in Z} y)$, for all non-empty subsets $Z$ of $L^*$, then $\tilde{T}$ is intuitionistic fuzzy left continuous $t$-norm.

Definition 1.6 [9] A negator on $L^*$ is a decreasing $L^* \rightarrow L^*$ mapping $\hat{N}$ that satisfies $\hat{N}(0_{L^*}) = 1_{L^*}$ and $\hat{N}(1_{L^*}) = 0_{L^*}$. If $\hat{N}(\hat{N}(x)) = x, \forall x \in L^*$, $\hat{N}$ is called an involutive negator. The mapping $\hat{N}$ defined as: $\hat{N}(x_1, x_2) = (x_2, x_1) \forall (x_1, x_2) \in L^*$ will be called the standard negator. An involutive negator on $L^*$ can always be related to an involutive negator on $[0, 1]$.

Definition 1.7 [9] An intuitionistic fuzzy implicant is an $(L^*)^2 \rightarrow L^*$ mapping $\tilde{I}$ satisfying $\tilde{I}(0_{L^*}, 0_{L^*}) = 1_{L^*}, \tilde{I}(0_{L^*}, 1_{L^*}) = 1_{L^*}, \tilde{I}(1_{L^*}, 0_{L^*}) = 0_{L^*}, \tilde{I}(1_{L^*}, 1_{L^*}) = 1_{L^*}$. Moreover, we require $\tilde{I}$ to be decreasing in its first and increasing in its second component.

Definition 1.8 [9] The intuitionistic fuzzy implicant $\tilde{I}$ is said to satisfy the left ordering property (LOP), if $x \leq_{L^*} y$, then $\tilde{I}(x, y) = 1_{L^*}$ for all $x, y \in L^*$.

Definition 1.9 [9] Let $\tilde{S}$ be a $t$-conorm and $\hat{N}$ a negator on $L^*$. The $S$-implicator generated by $\tilde{S}$ and $\hat{N}$ is the mapping $\tilde{I}_{\tilde{S}, \hat{N}} : (L^*)^2 \rightarrow L^*$ defined as, for all $x, y \in L^*$

$$\tilde{I}_{\tilde{S}, \hat{N}}(x, y) = \tilde{S}(\hat{N}(x), y).$$

(1)
Definition 1.10 [9] Let $\hat{T}$ be a t-norm on $L^*$. The R-implicator generated by $\hat{T}$ is the mapping $\hat{I}_{\hat{T}}$ defined as, for all $x, y \in L^*$:

$$\hat{I}_{\hat{T}}(x, y) = \sup\{\gamma \in L^* \mid \hat{T}(x, \gamma) \leq_{L^*} y\}. \quad (2)$$

Remark 1.11 [9] If we take $\hat{S} = \hat{S}_L$ and $\hat{N} = \hat{N}_s$ in (1), then, $\hat{I}_{\hat{S}_L, \hat{N}_s}(x, y) = (\min(1, y_1 + 1 - x_1, x_2 + 1 - y_2), \max(0, x_1 + y_2 - 1))$ is an extension of Lukasiewicz implicator on $[0, 1]$ to $L^*$ and is an S-implicator on $L^*$. Also this extension can be obtained by taking $\hat{T} = \hat{T}_L$ in (2) which makes it an R-implicator extension on $L^*$. Thus we have $\hat{I}_{\hat{S}_L, \hat{N}_s}(x, y) = \hat{I}_{\hat{T}_L}(x, y) = (\min(1, y_1 + 1 - x_1, x_2 + 1 - y_2), \max(0, x_1 + y_2 - 1))$. It is a contrapositive intuitionistic fuzzy extension of Lukasiewicz implicator to $L^*$.

2. Intuitionistic Fuzzy Bi-Implicators

In this section, we shall firstly present an axiomatic definition of an intuitionistic fuzzy bi-implicator and then will relate it to different new classes of intuitionistic fuzzy bi-implicators having constructive approaches.

Definition 2.1 An intuitionistic fuzzy bi-implicator is an $(L^*)^2 \rightarrow L^*$ mapping IBI satisfying for all $w, x, y, z \in L^*$:

(b1). $IBI(x, y) = IBI(y, x)$;
(b2). $IBI(0_{L^*}, 1_{L^*}) = 0_{L^*}$;
(b3). $IBI(x, x) = 1_{L^*}$;
(b4). If $w \leq_{L^*} x \leq_{L^*} y \leq_{L^*} z$, then $IBI(w, z) \leq_{L^*} IBI(x, y)$.

Example 2.2 Let for all $w, x, y, z \in L^*$ such that $w = (w_1, w_2)$, $x = (x_1, x_2)$, $y = (y_1, y_2)$ and $z = (z_1, z_2)$. Then the operator defined as:

$$IBI(x, y) = \begin{cases} 1_{L^*} & \text{if } x = y \\ \min(1 - x_2, 1 - y_2, \max(x_2, y_2)) & \text{if } x \neq y \end{cases}$$

is an intuitionistic fuzzy bi-implicator.

Indeed we will show that $IBI(x, y)$ satisfies the four axioms of Definition 2.1:

(b1). $IBI(x, y) = IBI(y, x)$. Straightforward.
(b2). $IBI(0_{L^*}, 1_{L^*}) = IBI((0, 1), (1, 0)) = (\min(1 - 1, 1 - 0), \max(1, 0)) = (0, 1) = 0_{L^*}$.
(b3). $IBI(x, x) = 1_{L^*}$, by its definition.
(b4). Let $w \leq_{L^*} x \leq_{L^*} y \leq_{L^*} z$. This implies $w_1 \leq x_1 \leq y_1 \leq z_1$ and $w_2 \geq x_2 \geq y_2 \geq z_2$ implies $1 - w_2 \leq 1 - x_2 \leq 1 - y_2 \leq 1 - z_2$ implies $IBI(w, z) = (\min(1 - w_2, 1 - z_2), \max(w_2, z_2)) = (1 - w_2, w_2)$ implies $\min(1 - w_2, 1 - z_2) \leq \min(1 - y_2, 1 - x_2)$ and $\max(w_2, z_2) \geq \max(y_2, x_2)$ implies $\min(1 - w_2, 1 - z_2, \max(w_2, z_2)) \leq_{L^*} \min(1 - y_2, 1 - x_2, \max(y_2, x_2))$ and hence $IBI(w, z) \leq_{L^*} IBI(x, y)$.

Remark 2.3 If we take $w = x$ in axiom (b4) of definition 2.1 then axiom (b4) can be equivalently replaced by axiom (b′4) provided $IBI$ satisfies (b1):

(b′4). If $x \leq_{L^*} y \leq_{L^*} z$, then $IBI(x, z) \leq_{L^*} IBI(x, y)$ and $IBI(x, z) \leq_{L^*} IBI(y, z)$.

Proof:
(i). (b4) $\implies$ (b′4)
Indeed putting $w = x$ in (b4) implies $IBI(x, z) \leq_{L^*} IBI(x, y)$ i.e. $IBI(x, \cdot)$ is decreasing for all $x \in L^*$. 

From \(x \leq L^* y \leq L^* z \leq L^* z\) it follows with (b4)\n\(IBI(x, z) \leq L^* IBI(y, z)\) i.e. \(IBI(., z)\) is increasing for all \(z \in L^*\).

(ii). \((b'4) \iff (b4)\)
Suppose \(w \leq L^* x \leq L^* y \leq L^* z\).
From \(IBI(w, .)\) being decreasing and \(x \leq L^* z\) we get:
\[
IBI(w, z) \leq L^* IBI(w, x).  \tag{3}
\]
From \(IBI(., x)\) being increasing and \(w \leq L^* y\) we get:
\[
IBI(w, x) \leq L^* IBI(y, x). \tag{4}
\]
From (3) and (4) we get: \(IBI(w, z) \leq L^* IBI(y, x)\) and hence if \(IBI\) satisfies \((b1) : IBI(w, z) \leq L^* IBI(x, y)\).

**Definition 2.4** Let \(\bar{T}\) be a left continuous intuitionistic fuzzy t-norm and \(\bar{I}_T\) be the corresponding intuitionistic fuzzy R-implicator. Then the intuitionistic fuzzy \(\kappa\)-bi-implicator is the \((L^*)^2 \rightarrow L^*\) mapping \(IBI_{\kappa}\) defined as:
\[
IBI_{\kappa}(x, y) = \bar{T}(\bar{I}_T(x, y), \bar{I}_T(y, x)).
\]

**Definition 2.5** Let \(\bar{T}'\) be an intuitionistic fuzzy t-norm, \(\bar{T}\) a left continuous intuitionistic fuzzy t-norm and \(\bar{I}_T\) be the corresponding intuitionistic fuzzy R-implicator. Then the intuitionistic fuzzy \(\beta\)-bi-implicator is the \((L^*)^2 \rightarrow L^*\) mapping \(IBI_{\beta}\) defined as:
\[
IBI_{\beta}(x, y) = \bar{T}'(\bar{I}_T(x, y), \bar{I}_T(y, x)).
\]

**Definition 2.6** Let \(\bar{T}'\) be an intuitionistic fuzzy t-norm, \(\bar{T}\) a left continuous intuitionistic fuzzy t-norm, \(\bar{I}_T\) be the corresponding intuitionistic fuzzy R-implicator and \(\bar{S}'\) be an intuitionistic fuzzy conorm. Then the intuitionistic fuzzy \(\bar{T}'\bar{S}'\)-bi-implicator is the \((L^*)^2 \rightarrow L^*\) mapping \(IBI_{\bar{T}'\bar{S}'}\) defined as:
\[
IBI_{\bar{T}'\bar{S}'}(x, y) = \bar{I}_T(\bar{S}'(x, y), \bar{T}'(x, y)).
\]

**Proposition 2.7** Let \(\bar{T}\) be a left continuous intuitionistic fuzzy t-norm and \(\bar{I}_T\) be the corresponding intuitionistic fuzzy R-implicator then it holds:
\[
x \leq L^* y \implies \bar{T}_M(\bar{I}_T(x, y), \bar{I}_T(y, x)) = \bar{I}_T(\bar{S}_M(x, y), \bar{T}_M(x, y)).
\]

**Proof** Suppose \(x \leq L^* y\). Then we obtain
\[
\bar{I}_T(x, y) = 1_{L^*}, \bar{T}_M(x, y) = x \text{ and } \bar{S}_M(x, y) = y.
\]
Hence,
\[
\bar{T}_M(\bar{I}_T(x, y), \bar{I}_T(y, x)) = \bar{T}_M(1_{L^*}, \bar{I}_T(y, x))
= \bar{I}_T(y, x) = \bar{I}_T(\bar{S}_M(x, y), \bar{T}_M(x, y)).
\]

**Proposition 2.8** Let \(\bar{T}'\) be an intuitionistic fuzzy t-norm, \(\bar{T}\) a left continuous intuitionistic fuzzy t-norm and \(\bar{I}_T\) be the corresponding intuitionistic fuzzy R-implicator, then the intuitionistic fuzzy \(\beta\)-bi-implicator \(IBI_{\beta}\) satisfies the following properties for all \(x, y \in L^*\):

\((b'1)\). \(IBI_{\beta}(x, y) = 1_{L^*}\) if \(x = y\) (reflexivity);
\((b'2)\). \(IBI_{\beta}(x, y) = IBI_{\beta}(y, x)\) (symmetry);
\((b'3)\). \(IBI_{\beta}(x, y) = \bar{T}'(\bar{I}_T(x, y), \bar{I}_T(y, x)) = \bar{T}_M(\bar{I}_T(x, y), \bar{I}_T(y, x))\) provided either \(x \leq L^* y\) or \(y \leq L^* x\);
\((b'4)\). \(IBI_{\beta}(x, y) = \bar{I}_T(\bar{S}_M(x, y), \bar{T}_M(x, y))\) provided \(x \leq L^* y\).

**Proof**
\((b'1)\). \(IBI_{\beta}(x, x) = \bar{T}'(\bar{I}_T(x, x), \bar{I}_T(x, x)) = \bar{T}'(1_{L^*}, 1_{L^*}) = 1_{L^*}\).
(b’2). $IBI_{\beta}(x, y) = \hat{T}'(\hat{I}_T(x, y), \hat{I}_T(y, x)) = \hat{T}'(\hat{I}_T(y, x), \hat{I}_T(x, y)) = IBI_{\beta}(y, x).

(b’3). From $x \leq_{L^*} y$ we get $\hat{I}_T(x, y) = 1_{L^*}$, and hence $IBI_{\beta}(x, y) = \hat{T}'(\hat{I}_T(x, y), \hat{I}_T(y, x)) = \hat{T}'(1_{L^*}, \hat{I}_T(y, x)) = \hat{I}_T(y, x) = T_M(\hat{I}_T(y, x), 1_{L^*}) = T_M(1_{L^*}, \hat{I}_T(y, x)) = T_M(\hat{I}_T(x, y), \hat{I}_T(y, x)).$

(b’4). Let $x \leq_{L^*} y$.

Then $IBI_{\beta}(x, y) = T_M(\hat{I}_T(x, y), \hat{I}_T(y, x)) = \hat{I}_T(\hat{S}_M(x, y), \hat{I}_T(x, y))$ (By Proposition 2.7).

**Proposition 2.9** An intuitionistic fuzzy bi-implicator $IBI$ is an intuitionistic fuzzy $\kappa$–bi-implicator if and only if it is an intuitionistic fuzzy $\beta$–bi-implicator.

**Proof** By taking $\hat{T}' = \hat{T}$ in the definition of intuitionistic fuzzy $\beta$–bi-implicator we can get an intuitionistic fuzzy $\kappa$–bi-implicator. Conversely, we need to show that a $\kappa$–bi-implicator is an intuitionistic fuzzy $\beta$–bi-implicator. Let $IBI_{\kappa}$ be an intuitionistic fuzzy $\kappa$–bi-implicator. Then we show that it satisfies all the axioms of Proposition 2.7 to become a $\beta$–bi-implicator.

(b’1). $IBI_{\kappa}(x, x) = \hat{T}(\hat{I}_T(x, x), \hat{I}_T(x, x)) = \hat{T}(1_{L^*}, 1_{L^*}) = 1_{L^*}$ by (LOP) and Definition 1.4.

(b’2). $IBI_{\kappa}(x, y) = \hat{T}(\hat{I}_T(x, y), \hat{I}_T(y, x)) = \hat{T}(\hat{I}_T(x, y), \hat{I}_T(y, x)) = IBI_{\kappa}(y, x).

(b’3). Suppose $x \leq_{L^*} y$ we get $\hat{I}_T(x, y) = 1_{L^*}$, and hence $IBI_{\kappa}(x, y) = \hat{T}(\hat{I}_T(x, y), \hat{I}_T(y, x)) = \hat{T}(1_{L^*}, \hat{I}_T(y, x)) = \hat{I}_T(y, x) = T_M(\hat{I}_T(y, x), 1_{L^*}) = T_M(1_{L^*}, \hat{I}_T(y, x)) = T_M(\hat{I}_T(x, y), \hat{I}_T(y, x)).$

(b’4). Suppose $x \leq_{L^*} y$.

Then it follows: $IBI_{\kappa}(x, y) = T_M(\hat{I}_T(x, y), \hat{I}_T(y, x)) = \hat{I}_T(\hat{S}_M(x, y), \hat{I}_T(x, y))$ (by Proposition 2.7).

**Proposition 2.10** An intuitionistic fuzzy $\kappa$–bi-implicator satisfies the axioms of Definition 2.1.

**Proof** Let $\hat{T}$ be a left continuous intuitionistic fuzzy t-norm and $\hat{I}_T$ be its intuitionistic fuzzy R-implicator and $IBI_{\kappa}$ be the intuitionistic fuzzy $\kappa$–bi-implicator based on $\hat{T}$ and $\hat{I}_T$. Then we only have to prove that an intuitionistic fuzzy $\kappa$– bi-implicator satisfies the axioms (b2) and (b4), as \( (b1) = (b2) \) and \( (b3) = (b1) \) have already been proved in Proposition 2.9.

(b2). $IBI_{\kappa}(0_{L^*}, 1_{L^*}) = \hat{T}(\hat{I}_T(0_{L^*}, 1_{L^*}), \hat{I}_T(1_{L^*}, 0_{L^*})) = \hat{T}(1_{L^*}, 0_{L^*}) = 0_{L^*},$

(b4). Suppose $w \leq_{L^*} x \leq_{L^*} y \leq_{L^*} z$. Then we obtain:

$IBI_{\kappa}(w, z) = \hat{T}_M(\hat{I}_T(w, z), \hat{I}_T(z, w))$ by (b’3) implies $IBI_{\kappa}(w, z) = \hat{T}_M(1_{L^*}, \hat{I}_T(z, w)) = \hat{I}_T(z, w)$ implies $IBI_{\kappa}(w, z) = \hat{I}_T(z, w) \leq_{L^*} \hat{I}_T(y, w) \leq_{L^*} \hat{I}_T(y, x)$ as $y \leq_{L^*} z$ and $w \leq_{L^*} x$

implies $IBI_{\kappa}(w, z) \leq_{L^*} \hat{I}_T(y, x) = \hat{T}_M(1_{L^*}, \hat{I}_T(y, x)) = \hat{T}_M(\hat{I}_T(x, y), \hat{I}_T(y, x))$

implies $IBI_{\kappa}(w, z) \leq_{L^*} \hat{I}_T(y, x) = \hat{T}_M(1_{L^*}, \hat{I}_T(y, x)) = \hat{T}_M(\hat{I}_T(x, y), \hat{I}_T(y, x))$

implies $IBI_{\kappa}(w, z) \leq_{L^*} \hat{I}_T(y, x) = \hat{T}_M(1_{L^*}, \hat{I}_T(y, x)) = \hat{T}_M(\hat{I}_T(x, y), \hat{I}_T(y, x))$.

**Proposition 2.11** An intuitionistic fuzzy $\hat{T}' \hat{S}'$–bi-implicator satisfies the properties (b1) and (b2) but may fail to satisfy the properties (b3) and (b4).

**Proof** Let $\hat{T}'$ be an intuitionistic fuzzy t-norm, $\hat{T}$ a left continuous intuitionistic fuzzy t-norm, $\hat{I}_T$ be its intuitionistic fuzzy R-implicator and $\hat{S}'$ be an
intuitionistic fuzzy conorm. Let $IBI_{p,q}^{r,s}$ be the intuitionistic fuzzy $T'$ $S'$ -bi-implicator based on $T$, $I_T$ and $S'$. Then we show that $IBI_{p,q}^{r,s}$ satisfies the properties (b1) and (b2) but may fail to satisfy the properties (b3) and (b4).

For all $x, y \in L^*$

(b1). $IBI_{p,q}^{r,s}(x, y) = I_T(S'(y, x), T'(x, y)) = I_T(S'(y, x), T'(x, y))$

For all $x, y \in L^*$

(b2). $IBI_{p,q}^{r,s}(0_{L^*}, 1_{L^*}) = I_T(S'(0_{L^*}, 1_{L^*}), T'(0_{L^*}, 1_{L^*})) = I_T(1_{L^*}, 0_{L^*}) = 0_{L^*}$.

In order to show that $IBI_{p,q}^{r,s}$ fails to satisfy (b3) and (b4) we shall present the following counter examples:

Let $x = (0.7, 0.1) \in L^*$. Then by Definitions (1.4),(1.5) and Remark 1.12 we have $S_P(x, x) = (0.91, 0.01)$ and $T_L(x, x) = (0.4, 0.2)$, which implies that $IBI_{T_L,S_P}(x, x) = I_{T_M}(S_P(x, x), T_L(x, x)) = (0.4, 0.2) \neq 1_{L^*}$.

Hence $IBI_{p,q}^{r,s}$ fails to satisfy (b3).

Let $w = (0.2, 0.7), x = (0.3, 0.4), y = (0.5, 0.3), z = (0.8, 0.1) \in L^*$. Then $S_L(w, z) = (1, 0), T_P(w, z) = (0.16, 0.73)$ and $S_L(x, y) = (0.8, 0), T_P(x, y) = (0.15, 0.58)$, which implies that $IBI_{T_P,S_L}(w, z) = I_{T_M}(S_L(w, z), T_P(w, z)) = (0.16, 0.73)$. Clearly, we see that $IBI_{T_P,S_L}(w, z) \not\leq L^* IBI_{T_P,S_L}(x, y)$ as $0.16 > 0.15$ and $0.58 < 0.73$.

Hence, $IBI_{T_P,S_L}$ fails to satisfy the property (b4).

**Remark 2.12** It must be noted that if we restrict ourself to the choice of all those $x, y \in L^*$ such that either $x \leq L^* y$ or $y \leq L^* x$ and $T$ to be a left continuous intuitionistic fuzzy t-norm and $I_T$ be the corresponding intuitionistic fuzzy R-implicator then, the class of all intuitionistic fuzzy $\kappa-$bi-implicators and the class of all intuitionistic fuzzy $\beta-$bi-implicators satisfies (b4). Thus they become the subclasses of the class of all intuitionistic fuzzy $T'$ $S'$ -bi-implicators.

## 3. Lukasiewicz Intuitionistic Fuzzy Bi-implicator

Next, we shall study in detail the properties of intuitionistic fuzzy $\beta-$bi-implicator by specifying intuitionistic fuzzy t-norms $T' = T_M$ and $T = T_L$ with an R-implicator $I = I_{T_L}$ respectively in its definition. For simplicity in results we drop the index $\beta$ in notation $IBI_\beta$ and from here onward we will use $IBI$ for such an intuitionistic fuzzy $\beta-$bi-implicator. Thus, for all $A, B \in IFS(X)$ and $x \in X$ we have:

$$IBI(A, B)(x) = T_M(I_{T_L}(A(x), B(x)), I_{T_L}(B(x), A(x)))$$

$$= (\min(1, b_1 - a_1 + 1, a_2 - b_2 + 1, a_1 - b_1 + 1, b_2 - a_2 + 1),$$

$$\max(0, a_1 + b_2 - 1, b_1 + a_2 - 1))$$

where $A(x) = (a_1, a_2) = (\mu_A(x), \nu_A(x)), B(x) = (b_1, b_2) = (\mu_B(x), \nu_B(x)) \in L^*$.

**Proposition 3.1** For all $A, B \in IFS(X)$,

(a) $IBI_\beta(A, B)(x) = 1_{L^*}$ if and only if $A(x) = B(x)$;

(b) $IBI_\beta(A, B) = I_X$ if and only if $A = B$;
(c) \(IBI_\beta(A, B)(x) = 0\) if and only if \(x \in Ker(A) \cap (Supp(B))^c \) or \(x \in Ker(B) \cap (Supp(A))^c \).

(d) \(IBI_\beta(A, B) = 0\) implies \(Ker(A) \cap (Supp(B))^c \neq \emptyset\) or \(Ker(B) \cap (Supp(A))^c \neq \emptyset\).

**Proof**

Let \(A, B \in IFS(X)\).

(a) \(IBI_\beta(A, B)(x) = 1\) for any \(x \in X\),

if and only if \(\bar{T}_M(\bar{I}_{\beta\gamma}(A(x), B(x)), \bar{I}_{\beta\gamma}(B(x), A(x))) = 1\).

if and only if \((\min(1, b_1 - a_1 + 1, a_2 - b_2 + 1, a_1 - b_1 + 1, b_2 - a_2 + 1), \max(0, a_1 + b_2 - 1, b_1 + a_2 - 1)) = 1\).

if and only if \(\{b_1 - a_1 + 1 \geq 0, a_2 - b_2 + 1 \geq 0, a_1 - b_1 + 1 \geq 0, b_2 - a_2 + 1 \geq 0\}

and \(a_1 + b_2 - 1 \leq 0, b_1 + a_2 - 1 \leq 0\)

if and only if \(b_1 \geq a_1, a_2 \geq b_2\)

and \(b_1 \geq a_1, b_2 \geq a_2\)

and \(a_1 = b_1 \) and \(a_2 = b_2\)

if and only if \(A(x) = B(x)\).

(b) \(IBI_\beta(A, B) = 1\)

if and only if \(IBI_\beta(A, B)(x) = 1\) for all \(x \in X\)

if and only if \(A(x) = B(x)\) for all \(x \in X\).

(c) \(IBI_\beta(A, B)(x) = 0\) for any \(x \in X\),

if and only if \(\bar{T}_M(\bar{I}_{\beta\gamma}(A(x), B(x)), \bar{I}_{\beta\gamma}(B(x), A(x))) = 0\).

if and only if \((\min(1, b_1 - a_1 + 1, a_2 - b_2 + 1, a_1 - b_1 + 1, b_2 - a_2 + 1), \max(0, a_1 + b_2 - 1, b_1 + a_2 - 1)) = 0\).

if and only if \(\{b_1 - a_1 + 1 = 0, a_2 - b_2 + 1 = 0, a_1 - b_1 + 1 = 0, b_2 - a_2 + 1 = 0\}

and \(\max(0, a_1 + b_2 - 1, b_1 + a_2 - 1) = 1\)

and \(\{a_2 - b_2 + 1 = 0\} \cup \{a_1 - b_1 + 1 = 0\} \cup \{a_1 + b_2 - 1, b_1 + a_2 - 1\} = 1\)

or \(\{b_2 - a_2 + 1 = 0\} \cup \{a_1 + b_2 - 1, b_1 + a_2 - 1\} = 1\).

Next, we discuss all these cases one by one such that they have a mutual relation of "or" between them.

Case 1: If \(b_1 - a_1 + 1 = 0\) then we have \(b_1 = 0, a_1 = 1, a_2 = 0\) and \(b_2 \leq 1\).

However, the condition \(\max(0, a_1 + b_2 - 1, b_1 + a_2 - 1) = 1\) will enforce \(b_2 = 1\).

Thus, we have \((a_1, a_2) = (1, 0)\) and \((b_1, b_2) = (0, 1)\) and hence \(x \in Ker(A) \cap (Supp(B))^c\).

Case 2: If \(a_2 - b_2 + 1 = 0\) then we get \(a_2 = 0, b_2 = 1, b_1 = 0\) and \(a_1 \leq 1\).

However, the condition \(\max(0, a_1 + b_2 - 1, b_1 + a_2 - 1) = 1\) will enforce \(a_1 = 1\).

Thus, we have \((a_1, a_2) = (1, 0)\) and \((b_1, b_2) = (0, 1)\) and hence \(x \in Ker(A) \cap (Supp(B))^c\).

Case 3: If \(a_1 - b_1 + 1 = 0\) then we have \(a_1 = 0, b_1 = 1, b_2 = 0\) and \(a_2 \leq 1\).

Likewise, to above two cases the condition \(\max(0, a_1 + b_2 - 1, b_1 + a_2 - 1) = 1\) will enforce \(a_2 = 1\).

Thus, we have \((a_1, a_2) = (0, 1)\) and \((b_1, b_2) = (1, 0)\) and hence \(x \in Ker(B) \cap (Supp(A))^c\).

Case 4: If we choose \(b_2 - a_2 + 1 = 0\) then we get \(b_2 = 0, a_2 = 1, a_1 = 0\) and \(b_1 \leq 1\). The condition \(\max(0, a_1 + b_2 - 1, b_1 + a_2 - 1) = 1\) will enforces \(b_1 = 1\).
Thus, we have \((a_1, a_2) = (0, 1)\) and \((b_1, b_2) = (1, 0)\) and hence \(x \in Ker(B) \cap (Supp(A))^c\).

Thus, all of these situations lead to the result:

\[ IBI_\beta(A, B)(x) = 0_{L^*} \implies x \in Ker(A) \cap (Supp(B))^c \text{ or } x \in Ker(B) \cap (Supp(A))^c. \]

Conversely, let \(x \in Ker(A) \cap (Supp(B))^c\) implies that \(x \in Ker(A)\) and \(x \in (Supp(B))^c\).

Now, \(x \in Supp(B) \iff (b_1 \neq 0 \text{ or } b_2 \neq 1)\) and hence \(x \in (Supp(B))^c \iff (b_1 = 0 \text{ and } b_2 = 1) \iff (b_1, b_2) = (0, 1)\).

implies that \([a_1, a_2] = (1, 0)\) and \((b_1, b_2) = (0, 1)\]

implies that \(\min(1, b_1 - a_1 + 1, a_2 - b_2 + 1, a_1 - b_1 + 1, b_2 - a_2 + 1) = 0\) and \(\max(0, a_1 + b_2 - 1, b_1 + a_2 - 1) = 1\)

implies that \((\min(1, b_1 - a_1 + 1, a_2 - b_2 + 1, a_1 - b_1 + 1, b_2 - a_2 + 1), \max(0, a_1 + b_2 - 1, b_1 + a_2 - 1)) = (0, 1)\)

implies that \(IBI_\beta(A, B)(x) = 0_{L^*}\).

Similarly, for \(x \in Ker(B) \cap (Supp(A))^c\) we get \(IBI_\beta(A, B)(x) = 0_{L^*}\).

Thus, \(x \in Ker(A) \cap (Supp(B))^c\) or \(x \in Ker(B) \cap (Supp(A))^c\) implies \(IBI_\beta(A, B)(x) = 0_{L^*}\).

(d). \(IBI_\beta(A, B) = 0_X\)

implies that \(IBI_\beta(A, B)(x) = 0_{L^*}\) for all \(x \in X\)

implies that either \([x \in Ker(A) \cap (Supp(B))^c]\) or \([x \in Ker(B) \cap (Supp(A))^c]\)

for all \(x \in X\)

implies that \(Ker(A) \cap (Supp(B))^c \neq \phi\) or \(Ker(B) \cap (Supp(A))^c \neq \phi\).

**Proposition 3.2** For all \(A, B \in IFS(X)\),

\[ IBI_\beta(A, B) = IBI_\beta(B, A). \]

**Proof** The result holds due to commutativity of \(\hat{T}_M\).

**Corollary 3.3** For \(A \in IFS(X)\),

(a). \(IBI_\beta(A, A^c)(x) = 1_{L^*}\) if and only if \(A(x) = (a_1, a_2)\) such that \(a_1 = a_2\);

(b). \(IBI_\beta(A, A^c) = \tilde{1}_X\) if and only if \(A(x) = (a_1, a_2)\) such that \(a = a_2\) for all \(x \in X\);

(c). \(IBI_\beta(A, A^c)(x) = 0_{L^*}\) if and only if either \(A(x) = 1_{L^*}\) or \(A(x) = 0_{L^*}\);

(d). \(IBI_\beta(A, A^c) = 0_X\) if and only if \(A = \tilde{1}_X\) or \(A = \tilde{0}_X\).

**Proof** Follows directly from Proposition 3.1 by taking \(B = A^c\).

**Proposition 3.4** For \(A, B \in IFS(X)\)

\[ IBI(A, B) = IBI(B^c, A^c). \]

**Proof** The result holds due to contrapositivity of the Lukasiewicz intuitionistic fuzzy implicator \(\hat{I}_{\beta_L}\) used in Definition 2.5.

**Proposition 3.5** For any \(A, B, C \in IFS(X)\) such that \(A \subseteq B \subseteq C\) we have:

(a). \(IBI_\beta(A, C) \subseteq \left\{ IBI_\beta(A, B), IBI_\beta(B, C) \right\}\) i.e., the first partial mapping \(IBI_\beta(\cdot, B)\)

of \(IBI_\beta\) is increasing and the second partial mapping \(IBI_\beta(A, \cdot)\) is decreasing;

(b). \(IBI_\beta(A, C) \subseteq \hat{T}_M(IBI_\beta(A, B), IBI_\beta(B, C))\).

**Proof** Let \(A, B, C \in IFS(X)\) such that \(A \subseteq B \subseteq C\).

(a). \(A(x) \leq_{L^*} B(x) \leq_{L^*} C(x)\) for all \(x \in X\)
implies that $a_1 \leq b_1 \leq c_1$ and $a_2 \geq b_2 \geq c_2$.
Now as, $[a_1 \leq b_1 \text{ and } a_2 \geq b_2 \text{ and } a_1 + a_2 \leq 1]$
implies that $1 \leq b_1 - a_1 + 1$ and $a_2 - b_2 + 1 \geq 1$
implies that $\min(1, b_1 - a_1 + 1, a_2 - b_2 + 1) = 1$ and $\max(0, a_1 + b_2 - 1) = 0$
implies that $\tilde{I}_{T} (A(x), B(x)) = (\min(1, b_1 - a_1 + 1, a_2 - b_2 + 1), \max(0, a_1 + b_2 - 1)) = (1, 0) = 1_{L^*}$
implies that $IBI_{\beta}(A, B)(x) = \tilde{T}_M(\tilde{I}_{T} (A(x), B(x)), \tilde{I}_{T} (B(x), A(x)))$
$= \tilde{I}_{F_{\beta}}(B(x), A(x)) = (\min(1, a_2 - b_1 + 1, b_2 - a_2 + 1), \max(0, b_1 + a_2 - 1))$. 
Similarly, we have $IBI_{\beta}(B, C)(x) = (\min(1, b_1 - c_1 + 1, c_2 - b_2 + 1), \max(0, c_1 + b_2 - 1))$ and $IBI_{\beta}(A, C)(x) = (\min(1, a_1 - c_1 + 1, c_2 - a_2 + 1), \max(0, c_1 + a_2 - 1))$.
Now as, $[a_1 - b_1 + 1 \geq a_1 - c_1 + 1 \text{ and } b_2 - a_2 + 1 \geq c_2 - a_2 + 1 \text{ also } c_1 + a_2 - 1 \geq b_1 + a_2 - 1]$
implies that $[\min(1, a_1 - c_1 + 1, c_2 - a_2 + 1) \leq \min(1, a_1 - b_1 + 1, b_2 - a_2 + 1)$
and $\max(0, c_1 + a_2 - 1) \geq \max(0, b_1 + a_2 - 1)]$
implies that $[\min(1, a_1 - c_1 + 1, c_2 - a_2 + 1), \max(0, c_1 + a_2 - 1) \leq_L \min(1, a_1 - b_1 + 1, b_2 - a_2 + 1), \max(0, b_1 + a_2 - 1)]$
implies that $IBI_{\beta}(A, C)(x) \leq_L^* \tilde{I}_{F_{\beta}}(B, C)(x)$ for all $x \in X$
implies that $IBI_{\beta}(A, C) \leq \tilde{I}_{F_{\beta}}(B, C)$.
Moreover, $[a_1 - c_1 + 1 \leq b_1 - c_1 + 1, c_2 - a_2 + 1 \leq c_2 - b_2 + 1 \text{ and } c_1 + a_2 - 1 \geq c_1 + b_2 - 1]$
implies that $\min(1, a_1 - c_1 + 1, c_2 - a_2 + 1) \leq \min(1, b_1 - c_1 + 1, c_2 - b_2 + 1)$
and $\max(0, c_1 + a_2 - 1) \geq \max(0, c_1 + b_2 - 1)$
implies that $\min(1, a_1 - c_1 + 1, c_2 - a_2 + 1), \max(0, c_1 + a_2 - 1) \leq_L \min(1, b_1 - c_1 + 1, c_2 - b_2 + 1), \max(0, c_1 + b_2 - 1)$
implies that $IBI_{\beta}(A, C)(x) \leq_L^* \tilde{I}_{F_{\beta}}(A, C)(x)$ for all $x \in X$
implies that $IBI_{\beta}(A, C) \leq \tilde{I}_{F_{\beta}}(A, C)$.
(b). $A(x) \leq_L^* B(x) \leq_L^* C(x)$ for all $x \in X$
implies that $a_1 \leq b_1 \leq c_1$ and $a_2 \geq b_2 \geq c_2$
implies that $\tilde{I}_{F_{\beta}}(A(x), B(x)) = 1_{L^*}, \tilde{I}_{F_{\beta}}(A(x), C(x)) = 1_{L^*}$ and $\tilde{I}_{F_{\beta}}(B(x), C(x)) = 1_{L^*}$
implies that $IBI_{\beta}(A, B)(x) = (\min(1, a_1 - b_1 + 1, b_2 - a_2 + 1), \max(0, b_1 + a_2 - 1))$, $IBI_{\beta}(B, C)(x) = (\min(1, b_1 - c_1 + 1, c_2 - b_2 + 1), \max(0, c_1 + b_2 - 1))$
and $IBI_{\beta}(A, C)(x) = (\min(1, a_1 - c_1 + 1, c_2 - a_2 + 1), \max(0, a_1 + b_2 - 1))$
Now $[a_1 - b_1 + 1 \geq a_1 - c_1 + 1, b_2 - a_2 + 1 \geq c_2 - a_2 + 1, b_1 - c_1 + 1 \geq a_1 - c_1 + 1,$
$c_2 - b_2 + 1 \geq c_2 - a_2 + 1 \text{ and } c_1 + b_2 - 1 \leq c_1 + a_2 - 1, b_1 + a_2 - 1 \leq c_1 + a_2 - 1]$ 
implies that $\min(1, a_1 - c_1 + 1, c_2 - a_2 + 1) \leq \min(1, b_2 - a_2 + 1, a_1 - b_1 + 1, b_1 - c_1 + 1, c_2 - b_2 + 1)$ and $\max(0, c_1 + a_2 - 1) \leq \max(0, c_1 + b_2 - 1, b_1 + a_2 - 1)$
implies that $\min(1, a_1 - c_1 + 1, c_2 - a_2 + 1) \leq \min(1, b_2 - a_2 + 1, a_1 - b_1 + 1, b_1 - c_1 + 1, c_2 - b_2 + 1)$ and $\max(0, c_1 + a_2 - 1) \geq \max(0, c_1 + b_2 - 1, b_1 + a_2 - 1)$
implies that $\min(1, a_1 - c_1 + 1, c_2 - a_2 + 1) \leq \min(1, b_2 - a_2 + 1, a_1 - b_1 + 1, b_1 - c_1 + 1, c_2 - b_2 + 1)$ and $\max(0, c_1 + a_2 - 1) \geq \max(0, c_1 + b_2 - 1, b_1 + a_2 - 1)$
implies that $\min(1, a_1 - c_1 + 1, c_2 - a_2 + 1) \leq \min(1, b_2 - a_2 + 1, a_1 - b_1 + 1, b_1 - c_1 + 1, c_2 - b_2 + 1)$ and $\max(0, c_1 + a_2 - 1) \geq \max(0, c_1 + b_2 - 1, b_1 + a_2 - 1)$
implies that $IBI_{\beta}(A, C)(x) \leq_L^* \tilde{T}_M(\tilde{I}_{F_{\beta}}(A, B)(x), \tilde{I}_{F_{\beta}}(B, C)(x))$ for all $x \in X$
implies that $IBI_{\beta}(A, C) \subseteq \tilde{T}_M(\tilde{I}_{F_{\beta}}(A, B), \tilde{I}_{F_{\beta}}(B, C)).$
Definition 3.6 For any $A, B \in IFS(X)$, $A$ is said to be pointwise comparable with $B$ if for all $x \in X$ either $A(x) \leq_{L^*} B(x)$ or $B(x) \leq_{L^*} A(x)$. Moreover, it may be noted that:
1. $A$ is pointwise comparable to $A$ for all $A \in IFS(X)$;
2. If $A$ is pointwise comparable with $B$ then $B$ is pointwise comparable to $A$;
3. If $A$ is pointwise comparable to $B$ and $B$ is pointwise comparable to $C$ then $A$ is comparable to $C$.

Proposition 3.7 For any $A, B \in IFS(X)$, such that $A$ and $B$ are pointwise comparable:
(a) $IBI_\beta(A, \tilde{T}_M(A, B)) = IBI_\beta(B, \tilde{S}_M(A, B))$;
(b) $IBI_\beta(A, \tilde{S}_M(A, B)) = IBI_\beta(B, \tilde{T}_M(A, B))$.

Proof
(a) Let $A, B \in IFS(X)$, such that $A$ and $B$ are pointwise comparable. Then for all $x \in X$, either $A(x) \leq_{L^*} B(x)$ or $B(x) \leq_{L^*} A(x)$ implies that either $\tilde{T}_M(A(x), B(x)) = A(x)$ and $\tilde{S}_M(A(x), B(x)) = B(x)$ or $\tilde{T}_M(A(x), B(x)) = B(x)$ and $\tilde{S}_M(A(x), B(x)) = A(x)$ implies that $IBI_\beta(A(x), \tilde{T}_M(A(x), B(x))) = IBI_\beta(A(x), A(x)) = 1_{L^*}$ and $IBI_\beta(B(x), \tilde{S}_M(A(x), B(x))) = IBI_\beta(B(x), B(x)) = 1_{L^*}$.

(b) The proof can be constructed in a similar way as part (a).

Proposition 3.8 For any $A, B \in IFS(X)$, such that $A$ and $B$ are pointwise comparable, the following intuitionistic fuzzy sets are equal:
(a) $IBI_\beta(A, B)$;
(b) $\tilde{T}_M(IBI_\beta(\tilde{T}_M(A, B), A), IBI_\beta(A, \tilde{S}_M(A, B)))$;
(c) $\tilde{T}_M(IBI_\beta(B, \tilde{S}_M(A, B)), IBI_\beta(B, \tilde{S}_M(A, B)))$;
(d) $IBI_\beta(\tilde{T}_M(A, B), \tilde{S}_M(A, B))$;
(e) $\tilde{T}_M(IBI_\beta(A, \tilde{S}_M(A, B)), IBI_\beta(B, \tilde{S}_M(A, B)))$;
(f) $\tilde{T}_M(IBI_\beta(A, \tilde{T}_M(A, B)), IBI_\beta(B, \tilde{T}_M(A, B)))$.

Proof Let $A, B \in IFS(X)$, such that $A$ and $B$ are pointwise comparable. Then, for all $x \in X$, either $A(x) \leq_{L^*} B(x)$ or $B(x) \leq_{L^*} A(x)$ implies that for any $x \in X$, either $\tilde{T}_M(A(x), B(x)) = A(x)$ and $\tilde{S}_M(A(x), B(x)) = B(x)$ or $\tilde{T}_M(A(x), B(x)) = B(x)$ and $\tilde{S}_M(A(x), B(x)) = A(x)$.

For simplicity of proofs we consider the cases of all those $x \in X$ for which $A(x) \leq_{L^*} B(x)$ i.e., $\tilde{T}_M(A(x), B(x)) = A(x)$ and $\tilde{S}_M(A(x), B(x)) = B(x)$ then,
(b) $\tilde{T}_M(IBI_\beta(\tilde{T}_M(A(x), B(x)), A(x)), IBI_\beta(A(x), \tilde{S}_M(A(x), B(x))))$ $= \tilde{T}_M(IBI_\beta(A(x), A(x)), IBI_\beta(A(x), B(x)))$ $= \tilde{T}_M(1_{L^*}, IBI_\beta(A, B)(x))$ $= IBI_\beta(A, B)(x)$.
(c) $\tilde{T}_M(IBI_\beta(\tilde{T}_M(A(x), B(x)), B(x)), IBI_\beta(B(x), \tilde{S}_M(A(x), B(x))))$ $= \tilde{T}_M(IBI_\beta(A(x), B(x)), IBI_\beta(B(x), B(x)))$ $= \tilde{T}_M(IBI_\beta(A, B)(x), 1_{L^*})$ $= IBI_\beta(A, B)(x)$.
(d) $IBI_\beta(\tilde{T}_M(A, B), \tilde{S}_M(A, B))(x)$
\[ IBI_\beta(A(x), B(x)) = IBI_\beta(A, B)(x). \]

(e) \( T_M(IBI_\beta(A, \tilde{S}_M(A, B)), IBI_\beta(B, \hat{S}_M(A, B)))(x) = T_M(IBI_\beta(A(x), B(x)), 1_{L^*}) = IBI_\beta(A, B)(x) \).

(f) \( T_M(IBI_\beta(A, \tilde{T}_M(A, B)), IBI_\beta(B, \hat{T}_M(A, B)))(x) = T_M(IBI_\beta(A(x), A(x)), IBI_\beta(B(x), A(x))) = T_M(1_{L^*}, IBI_\beta(B(x), A(x))) = IBI_\beta(B(x), A(x)) = IBI_\beta(A(x), B(x)) = IBI_\beta(A, B)(x) \) (because of the symmetry of \( IBI_\beta \)).

The above results also hold for all those \( x \in X \), for which \( B(x) \leq_{L^*} A(x) \).

**Conclusion**

In this research a detailed study of intuitionistic fuzzy bi-implicators was presented. Several new classes of intuitionistic fuzzy bi-implicators were introduced. The inter-relationship of these classes was also studied. Moreover, the properties of one of the introduced classes called \( \beta \)-bi-implicators were developed by employing the intuitionistic fuzzy Lukasiewicz implicator along with intuitionistic fuzzy \( \text{Min} \) t-norm in its definition. Such a knowledge not only provides a better understanding about the structural details of the particular class but also signifies the role of a bi-implicator in defining any similarity relation between two intuitionistic fuzzy sets.
